

# Breaking the Monolithic: Architecting Microapps on HCL Domino

Richard Moy - April 21th, 2026

- Managing Director of Phora Group
- Life-time IBM Champion
- Life-time HCL Ambassador
- Working with Notes since 1995
- Still a big fan of Dojo Toolkit
- Coordinator for CollabSphere for 15 years
- Grandpa
- Hiking and biking enthusiast

# About Phora Group

- HCL/IBM Business Partner
- HCL Domino consultants since 2003
- Business process automation services since 2009
- Primary focused on Web-based solutions
- Over 60+ years of combined experience in Notes/Domino

# About Phora Group

Creators of the iPhora family of Domino-based products

- iPhora AppBuilder    – No code application builder
- iPhora AppPlace    – Place-based platform to distribute and run apps
- iPhora Automate    – No code process automation platform

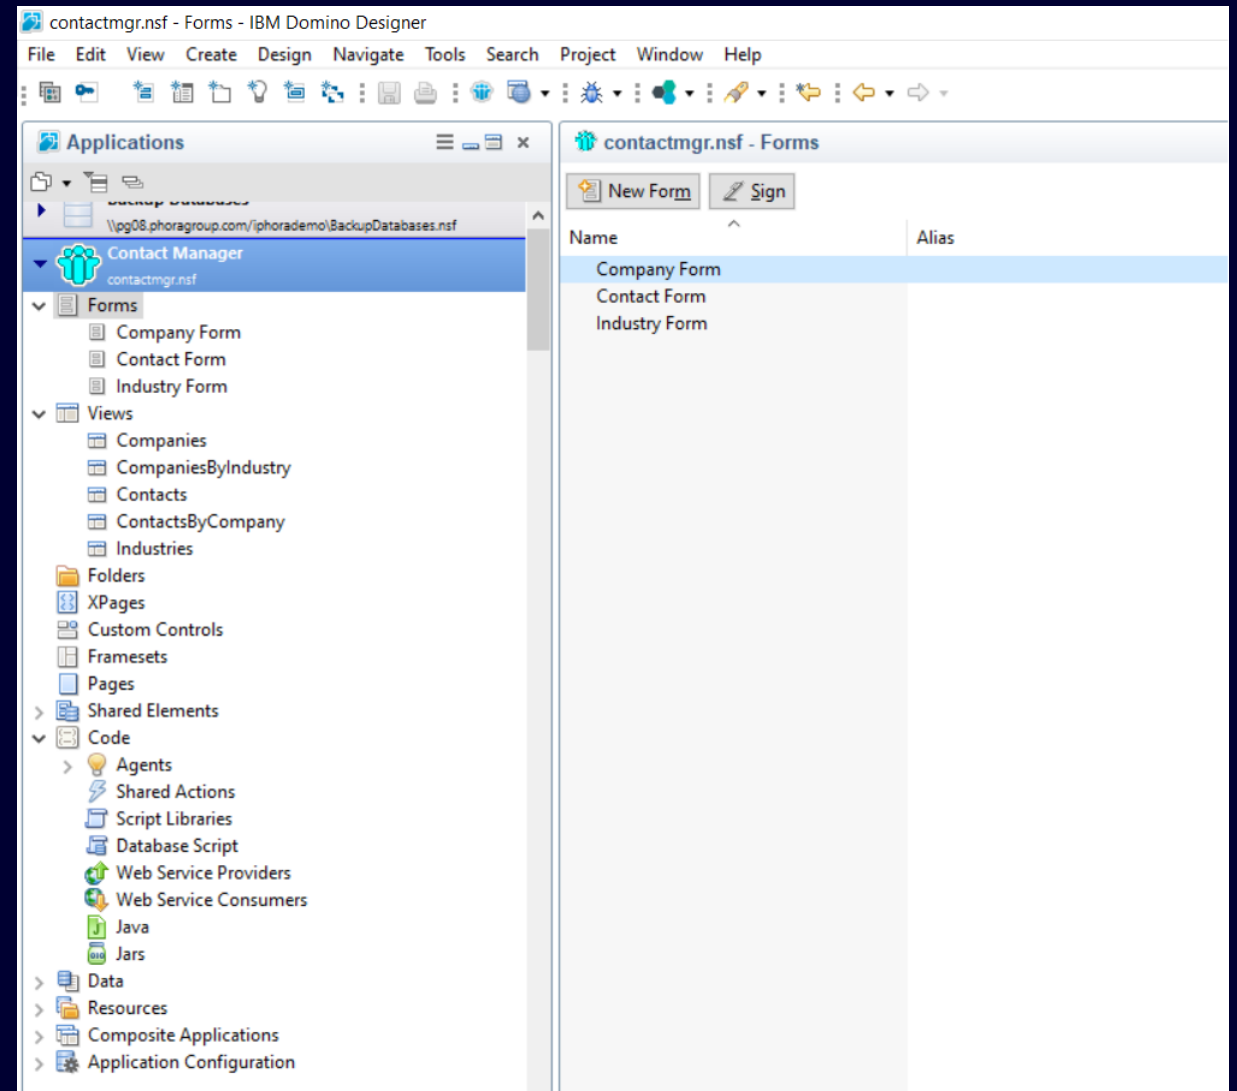

## iPhora Automate

- Try iPhora Automate on <https://iphora.io>
- New released version, v2026043001.

# Building a Domino App

- Forms
- Views
- Pages
- Agents
- Navigators
- Java
- LotusScript
- Formula Language
- JavaScript

# Building a Domino App

- Most start off simple
- Add more and more features into a single Domino database
- Requires more and more modifications to hold things together
- Splitting up the applications to multiple databases
- Add code to connect to external services
- More and more patches are added to make things work.
- Making it become monolithic

# Challenges of Monolithic Apps

- Complexity
- Changes become more and more difficult and slower
- Integration of new technologies is harder
- Scalability
- Deployment and reliability
- Usability

# Our Microapp Use Case

In designing and building our series of products, we found:

- App creation by individual business users
- Ability for these apps to be plug and play
- Ability for apps to share data and services
- Deployment of apps via an app store
- Scalable solutions
- Simple consistent user interfaces throughout apps

# The Rise of Mobile Apps

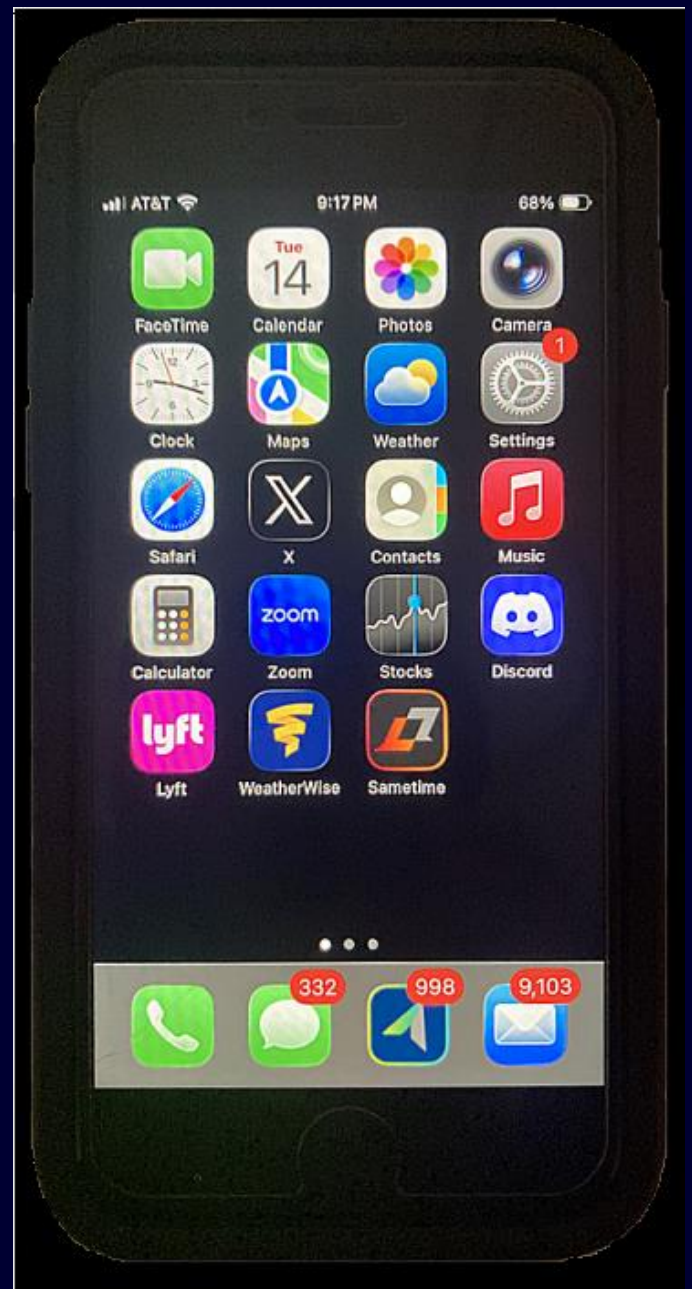

- 1997 - the first mobile app from Nokia
- 2007 – Apple App Store
- 2026 - 4 Million+ Mobile apps

Mobile apps are generally very task specific and maintains a consistent and intuitive user interface.

# Genesis of Microapps

- Businesses wanted to apply similar design to their enterprise applications.
- Businesses wanted the simplified approach of separating the functionality into different apps
- Businesses wanted to incorporate the same intuitive user interfaces.
- Businesses identified the effective development approach that lessen the need for support.

# What are Microapps?

- Autonomous applications are built for a single purpose.
- Each microapp performs a set of focused task
- Provide a consistent user experience throughout the apps
- Disposable
- Web-based
- Notification driven

Popularity of microapps is driven by vibe coding and no-coding where users can create their own app

# Key Benefits of Micro Apps

- Faster development and deployment
- Improved user focus and adoption
- Easier maintenance and updates
- Integration with enterprise systems
- Scalability and flexibility
- Can be created by the “consumer”

## Consumer

- “Disposable” including data
- Microapps are mostly standalone
- Need to inhere to the need of the individual consumer
- Localize security
- Individual productivity
- Individual creator/contributor

## Enterprise

- **“Disposable” but not data**
- Microapps need to integrated with other microapps and enterprise solutions
- Need to inhere to corporate governance
- Enterprise security
- Multiple users
- Multiple creators/contributors

# Attributes of Enterprise Microapps

- Pluggable API-led development
- Security and control
- Deployment via an app store
- Microservices-based systems
- Event bus driven
- Automated low-code/no-code development

- User could create apps
- Targeted single purpose task
- Security and control
- Application template

# Challenges in Building Microapps on Domino

- No out of the box ability for creating apps using no-code / low-code / vite coding
- No consistent framework for web-based apps
- Domino apps in general are not API driven platform
- Domino does not support a microservice architecture
- Domino does not provide an event bus architecture

# Advantages in Building Apps on Domino

- Full built-in enterprise security
- Full control of data ( private and sovereign )
- Flexible application environment
- Domino databases are inherently container-based

To create enterprise microapps on Domino we need to have:

- User driven application development
- Plug and play API driven architecture
- Microservices architecture
- Event Bus

Domino provides a flexible app container where you have many ways of creating the UI

- No-code tools
- Vibe coding
- Domino Leap (limited)

HCL Domino allows you to build APIs

- LotusScript/Java Agents
- Java
- Xpage agents
- DAS

Domino does not support microservices. However, it does have:

- Run on server agents
- Scheduled agents

Creating a Service Oriented Architecture (SOA) Platform with Domino

October 16, 2025

# openntf

SOA SERVICE (Microservice)

RUN ON SERVER AGENT (LOOSELY)

## **Services:**

Reusable components that each performing a distinct business function.

## **Loose coupling:**

Services are designed to be independent

## **Standardization:**

Standard interfaces and protocols

Doc

# Event Document: Service Chain

```
{
  "id": "apple",
  "server": "ACME01/ACME1",
  "db": "mydb",
  "esb": "mailin1",
  "service": "myagent1",
  "async": "no",
  "data": {
    "id": "a",
    "label": "b"
  },
  "next_id": "orange"
}, {
  "id": "orange",
  "server": "ACME02/ACME2",
  "db": "my2db",
  "esb": "mailin1",
  "service": "myagent2",
  "async": "yes",
  "data": {
    "id": "a",
    "label": "b"
  }
  "next_id": ""
}
```

# Transport Document: Memo

## Fields

subject:	universal ID of the payload document
server:	name of the targeted server/domain
database:	directory path of the targeted database that has the ROSA
agent:	name of the targeted ROSA

# Payload Document: Posted Data

```
{  
  "firstname": "John",  
  "lastname": "Smith",  
  "company": "Acme Corporation",  
  "email": "johnsmith@acme.com",  
  "service": "myagent",  
  "serviceid": "apple",  
  "eventid": "event1"  
}
```

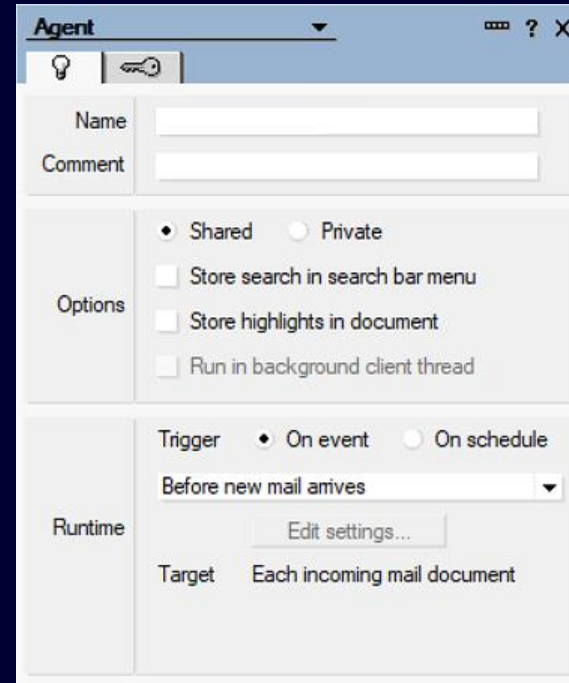

Analogous to a Domino agent parameterDoc

# Triggered By Before Mail Arrives Events

PUBLISHING ROSA

## NON-BLOCKING ASYNCHRONOUS PROCESS

- On Event agent
- Creates payload document
- Run targeted schedule agent using command line shell

The screenshot shows the configuration window for an Agent. The window title is "Agent". It has a search icon and a key icon in the top left. The configuration is divided into several sections:

- Name:** A text input field.
- Comment:** A text input field.
- Options:**
  - Shared  Private
  - Store search in search bar menu
  - Store highlights in document
  - Run in background client thread
- Trigger:**
  - On event  On schedule
  - Before new mail arrives (dropdown menu)
- Runtime:**
  - Edit settings... (button)
  - Target: Each incoming mail document

Call `session.SendConsoleCommand( TS ,|tell amgr run "| & TP &|" '| & ROSA &|')`

Information found in the transport document

TS: target server

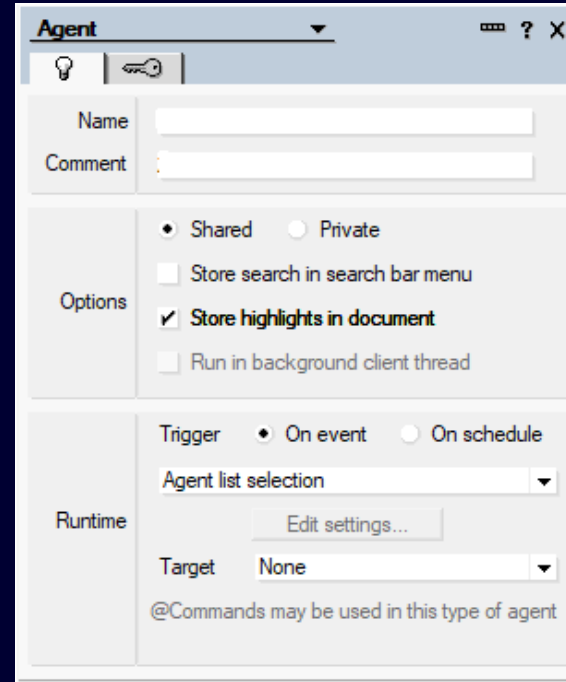

TP: target database path

ROSA: Name of the run on server agent

## SUBSCRIBING ROSA

“async” : “yes”

- Scheduled Agent
- Scans in Event Bus View to find all payload documents that it needs to process that is assigned to itself
- Reads the payload document for the submitted data
- Runs Business Logic for service

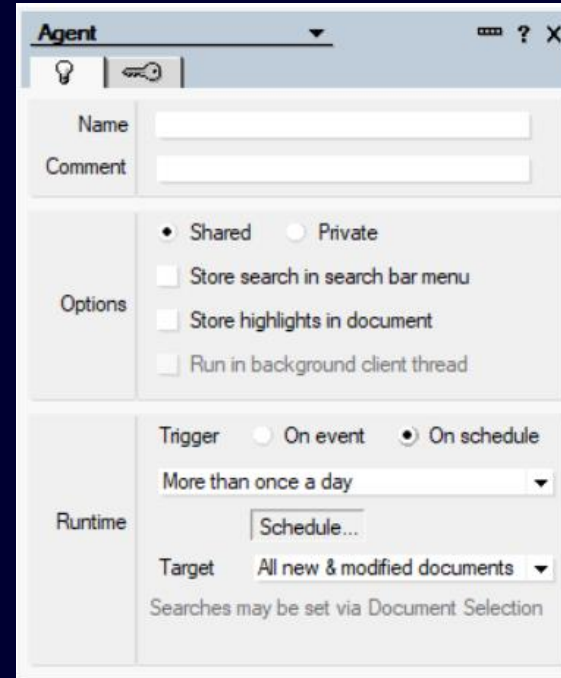

The screenshot shows the 'Agent' configuration window with the following fields and options:

- Name:** [Empty text field]
- Comment:** [Empty text field]
- Options:**
  - Shared  Private
  - Store search in search bar menu
  - Store highlights in document
  - Run in background client thread
- Runtime:**
  - Trigger:**  On event  On schedule
  - Agent list selection:** [Dropdown menu]
  - Edit settings...:** [Button]
  - Target:** [None] [Dropdown menu]
  - @Commands may be used in this type of agent

## SUBSCRIBING ROSA

“async” : “no”

- Scheduled Agent
- Scans in Event Bus View to find any request that it needs to process
- Reads the payload document for the submitted data
- Runs Business Logic for service
- Get next service in the service chain from event document
- Creates payload document
- Creates transport document ( memo)
- Sends message to ESB (mail-in db)

The screenshot shows the 'Agent' configuration window with the following sections:

- Name:** A text input field.
- Comment:** A text input field.
- Options:**
  - Shared  Private
  - Store search in search bar menu
  - Store highlights in document
  - Run in background client thread
- Runtime:**
  - Trigger:  On event  On schedule
  - Frequency: More than once a day (dropdown menu)
  - Schedule... (button)
  - Target: All new & modified documents (dropdown menu)
  - Searches may be set via Document Selection (text)

IBM Granite 4.0: hyper-efficient, high performance hybrid models for enterprise

# Sales App

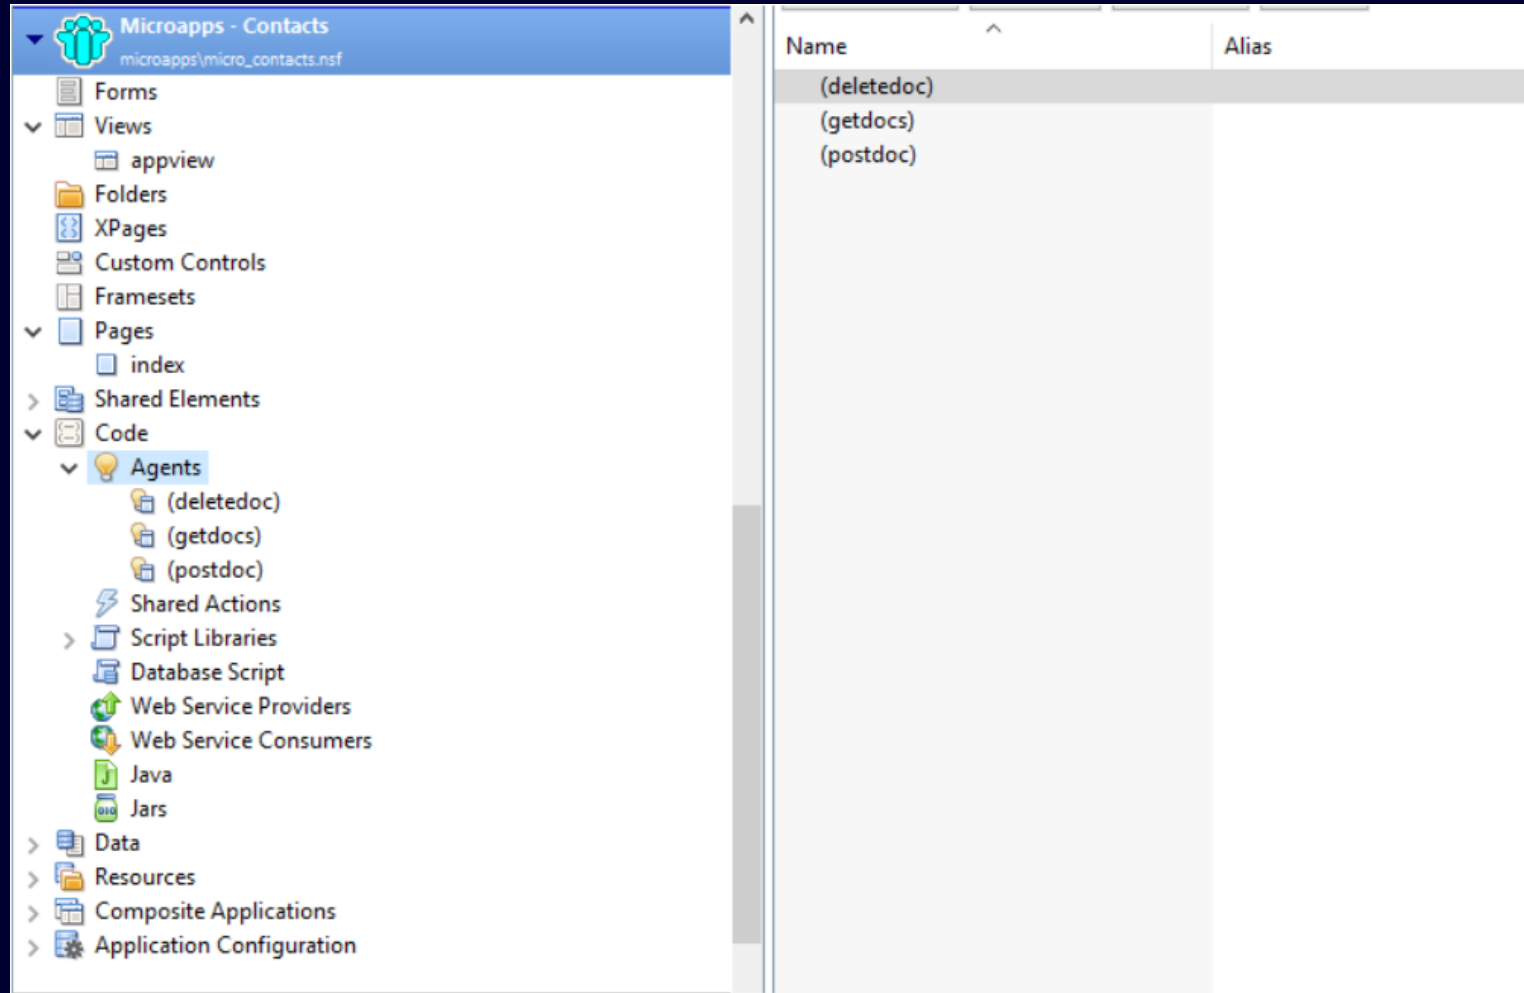

## Domino Microapp Contains:

- Single Web Page
- One Domino Page to hold the UI
- No Domino Views ( Not Needed by Required by Domino)
- Page specific JavaScript code
- App specific services , synchronous and asynchronous ( Run On Server agents )

- Lenovo, ThinkCentre
- Docker 29.3.1
- HCL Domino 12.02 FP7
- Mac Mini 4, Ollama 0.20.7 server
- IBM Granite4:7b-a1b-h model
- Microapp using Classic Domino Web Development

# Domino-based Microapp Architecture

The screenshot displays the Domino Designer interface for a microapp project named "Microapps - Contacts" (microapps/micro\_contacts.nsf). The left pane shows a hierarchical file tree with the following structure:

- Microapps - Contacts (microapps/micro\_contacts.nsf)
  - Forms
  - Views
    - appview
  - Folders
  - XPages
  - Custom Controls
  - Framesets
  - Pages
    - index
  - Shared Elements
  - Code
    - Agents
      - (deletedoc)
      - (getdocs)
      - (postdoc)
    - Shared Actions
    - Script Libraries
    - Database Script
    - Web Service Providers
    - Web Service Consumers
    - Java
    - Jars
  - Data
  - Resources
  - Composite Applications
  - Application Configuration

The right pane shows a table with two columns: "Name" and "Alias". The table contains three rows of data:

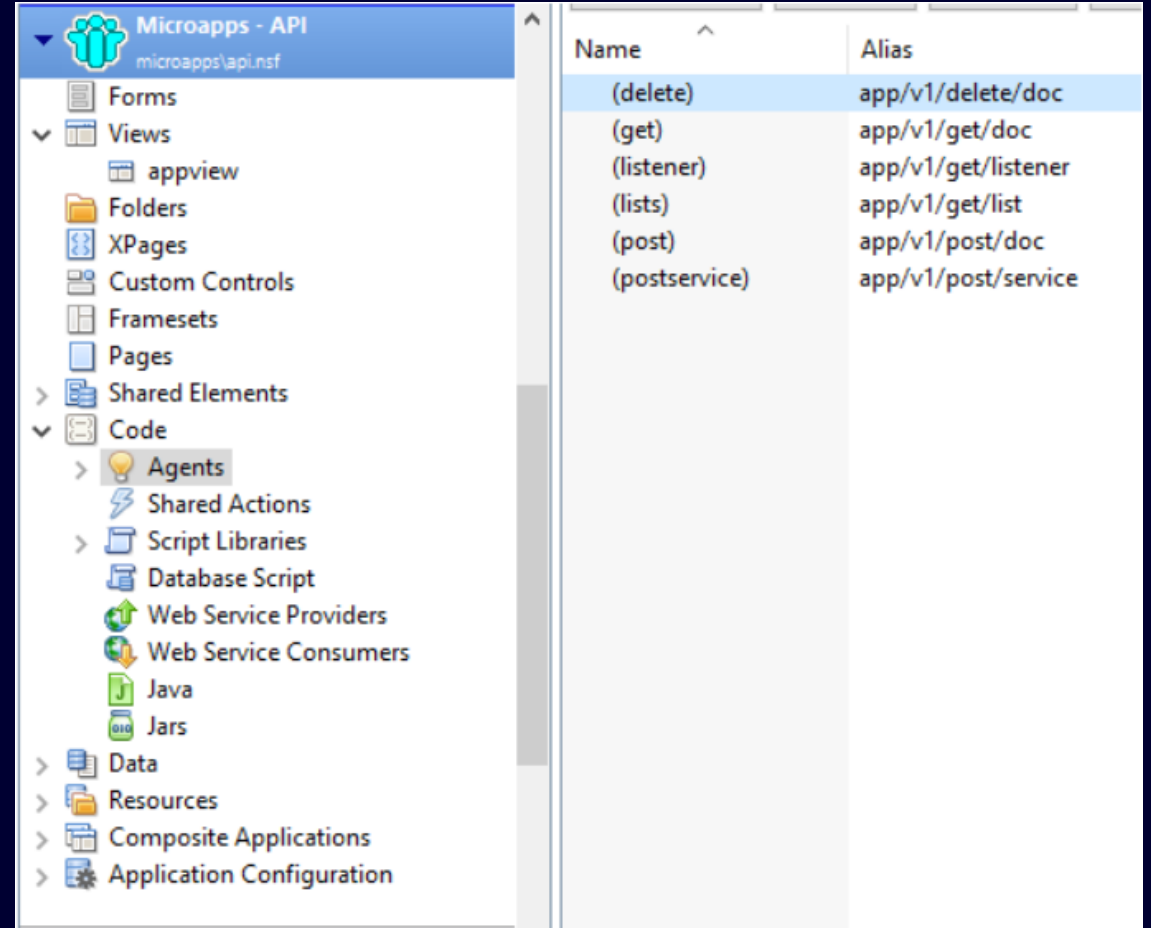

Name	Alias
(deletedoc)	
(getdocs)	
(postdoc)	

## Domino Microapp Contains:

- Reusable framework that can be used by all apps
- Allow the creator to focus only on the UI experience
- Allow the creator the ability to create microapps using:
  - No-code
  - Low-code
  - Vibe-code

Fix supported APIs endpoints:

- `app/v1/delete/doc`
- `app/v1/get/doc`
- `app/v1/get/list`
- `app/v1/get/listener`
- `app/v1/post/doc`
- `app/v1/post/service`

The screenshot shows the Domino Microapps - API interface. The left pane displays a tree view of the application structure, including Forms, Views, Folders, XPages, Custom Controls, Framesets, Pages, Shared Elements, Code, Agents, Shared Actions, Script Libraries, Database Script, Web Service Providers, Web Service Consumers, Java, Jars, Data, Resources, Composite Applications, and Application Configuration. The right pane displays a table of supported API endpoints.

Name	Alias
(delete)	app/v1/delete/doc
(get)	app/v1/get/doc
(listener)	app/v1/get/listener
(lists)	app/v1/get/list
(post)	app/v1/post/doc
(postservice)	app/v1/post/service

## Domino Microapp Contains:

- Sync microservices ( Run On Server Agents )
- Async microservices ( Scheduled Server Agents )
- Not true microservices, they do not replicate and scale when needed but provides the same concept

## Event Bus Driven:

- Allow for Plug and play integration
- Integration to Web services
- Integration to Artificial Intelligences (AI)

- Domino provides all the tools for you to create an enterprise microapp platform
- Rethink what Domino databases are, as secure Web app containers
- Building microapps on Domino provide one key advantage over other platforms, security
